STACK

WORK IN DAILY

Claude Code · TypeScript ·
React · Next.js

AI ENGINEERING

Claude API · MCP servers · sub-agent workflows · context engineering

STATE & DATA

TanStack Query · React Context · react-hook-form

UI LAYER

MUI · styled-components · HTML · CSS

BACKEND

Python · Django · PostgreSQL · REST APIs

SHIP & KEEP IT STABLE

Docker · Git · GitHub Actions (CI/CD) · automated quality gates

TEAM

GitHub · GitLab · Jira · Trello

LANGUAGES

Uzbek	Native
Russian	C2
English	B2

EDUCATION

BSc, Mathematical Support & Administration of Information Systems

North-Caucasus Federal University
Faculty of IT & Telecommunications
Stavropol · 2018 — 2022

Ruzimurod Doniev

FULLSTACK AI ENGINEER · AGENT-FIRST DELIVERY

I build the parts other people's work depends on — and I build them AI-first. Over **1.5+ years** at Upgrow I've shipped admin platforms that businesses run their day on; **Claude Code is my daily driver**, so work that took days of hand-editing now lands the same morning. **React**, **Next.js** and **TypeScript** are where I'm deepest; **Python**, **Django** and **PostgreSQL** are where I go when the problem lives behind the API.

EXPERIENCE

Frontend Developer · Upgrow

04/2025 — Present

Full-time · Tashkent · Web agency building client platforms

PRODUCT

- Shipped the **admin platform** behind Upgrow's client work — React and TypeScript, **TanStack Query** for server state, React Context for app state, MUI and styled-components for the UI layer. Retail stores and education centers run their daily operations on it.
- Turned requirements that kept repeating across clients — data tables, filtering, role-based views — into a **shared module set**, so each new dashboard starts from working parts instead of an empty file.
- Built the difficult forms: multi-step flows with conditional fields and cross-field validation on **react-hook-form**, in place of hand-rolled state that had been breaking on edge cases.

AI-FIRST ENGINEERING

- Work **agent-first**: I scope the feature and the constraints, Claude Code writes the diff, and I review it like a colleague's — the model types, I own the architecture.
- Built the **context layer** agents need on a real repository — CLAUDE.md conventions, project skills and MCP servers wired to our tooling.
- Fan work out to **sub-agents**: audits, cross-file refactors and repo-wide searches run in parallel while I keep shipping.

PLATFORM & DELIVERY

- Made deployment a merge instead of a checklist: built the **GitHub Actions CI/CD** pipelines that take a branch to production automatically.
- Moved lint and formatting arguments into the pipeline, then made **AI the first reviewer** on every branch — before a human opens the diff.
- Own **cross-browser** defects end to end — reproduce, isolate, fix, verify in production.
- Brought **Next.js** into the stack for server-side rendering and file-based routing, and carried the team through the migration.

BACKEND & INFRASTRUCTURE

- Built and maintained **REST APIs in Python and Django** — data models, migrations and the endpoints the dashboards consume — so I can close a feature on both sides of the wire instead of waiting on a handoff.
- Containerised services with **Docker**, so local development, CI and production run the same image rather than drifting apart.
- Designed and queried **PostgreSQL** schemas behind the dashboard features, including migrations and the indexes the slow pages needed.

HOW I WORK

- The fastest engineer in the room isn't the one who types fastest. If a task is mechanical, it belongs to an agent; if it's a judgement call, it belongs to me.
- I'd rather ship a small change through an **automated pipeline** than a large one by hand, and I optimise for whoever opens the file next.
